

NOTE

Step1: Save model and load this model during FastAPI creation.

Step2: Create a FastAPI file and write some code inside this file to show output and API creation. For this we have to load FastAPI

Step3: Create a virtual environment and work under a virtual environment.

Step4: Generate requirement.txt file in which all required modules are stated.

Step5: Create dockerFile in which we have to give some commands to run some file and code.

Step6: Finally create a Customer Docker image ,the location of the docker image in the local machine is **/var/lib/docker/**.
